

Project Design Phase
Problem – Solution Fit Template

Date	
Team ID	
Project Name	Optimizing User, Group, and Role Management with Access Control and Workflows
Maximum Marks	2 Marks

1. Customer Segment(s)

The primary customers for this solution are organizations that use the ServiceNow platform to manage users, groups, and roles. The system is mainly used by System Administrators, Project Managers, Team Members, and IT administrators responsible for managing user access and organizational resources.

2. Jobs-to-be-Done / Problems

The customers need a secure and efficient way to manage user accounts, organize users into groups, assign appropriate roles, and control access to organizational resources. They also require automated approval workflows and notifications to reduce manual work and improve productivity.

3. Triggers

Organizations look for an improved access management solution when they experience security issues, delayed approvals, manual administrative work, unauthorized access, or difficulties in managing a growing number of users and projects.

4. Emotions (Before / After)

Before implementing the solution, administrators may feel frustrated due to repetitive manual tasks, permission errors, and inefficient user management. After implementing the solution, they gain confidence through centralized administration, automated workflows, improved security, and simplified access management.

5. Available Solutions

Many organizations manage users and permissions manually or use separate systems for access management and workflow approvals. These methods often increase

administrative effort and make permission management more difficult. ServiceNow provides a centralized platform that combines user management, access control, and workflow automation.

6. Customer Constraints

Organizations may face constraints such as limited administrative resources, increasing numbers of users, security requirements, compliance policies, and the need to minimize manual work while maintaining accurate access control.

7. Customer Behaviour

Administrators regularly create user accounts, assign roles, manage groups, review access permissions, process approval requests, and monitor user activities. They expect these tasks to be completed accurately, securely, and with minimal manual effort.

8. Channels of Behaviour

Online

Customers access the ServiceNow platform through a web browser to manage users, groups, roles, workflows, approvals, and reports. They also receive email notifications for approvals and task updates.

Offline

Administrators discuss access requirements with department managers, maintain organizational policies, and coordinate user onboarding and role assignments based on business needs.

9. Problem Root Cause

The primary cause of the problem is the manual management of users, permissions, and approval processes. As organizations grow, managing access manually becomes increasingly difficult, resulting in security risks, inconsistent permissions, and reduced operational efficiency.

10. Proposed Solution

The proposed ServiceNow solution centralizes user, group, and role management while enforcing secure access through Role-Based Access Control (RBAC) and Access Control Lists (ACLs). Flow Designer automates approvals, notifications, and task assignments, reducing administrative effort, improving security, and ensuring efficient management of organizational resources.
