

Project Design Phase
Proposed Solution Template

Date	
Team ID	
Project Name	Optimizing User, Group, and Role Management with Access Control and Workflows
Maximum Marks	2 Marks

1. Problem Statement

Managing users, groups, and roles manually can be a complex and time-consuming process for organizations. Improper assignment of permissions may result in unauthorized access, security risks, and inefficient management of project resources. Manual approval processes and lack of centralized access control can also lead to delays, errors, and reduced productivity. Therefore, there is a need for a secure and automated system to efficiently manage users, groups, roles, and access permissions.

2. Idea / Solution Description

The proposed solution uses the ServiceNow platform to optimize user, group, and role management through a centralized administration system. Administrators can create and manage user accounts, organize users into groups, assign appropriate roles, and define access permissions using Access Control Lists (ACLs). Workflow automation is implemented using Flow Designer to automate task assignments, approval processes, and notifications. This solution improves security, reduces manual effort, and ensures efficient management of organizational resources.

3. Novelty / Uniqueness

The uniqueness of this solution lies in combining user management, group management, role assignment, access control, and workflow automation within a single ServiceNow platform. The solution replaces manual administrative tasks with automated processes, providing secure role-based access, improved operational efficiency, and centralized management of organizational resources.

4. Social Impact / Customer Satisfaction

The proposed solution enhances organizational efficiency by providing secure and well-managed access to users based on their responsibilities. Automated workflows reduce administrative delays, while role-based access ensures that sensitive information is protected. The system promotes better collaboration, improves productivity, and provides a reliable user experience for administrators, project managers, and team members.

5. Business Model (Revenue Model)

The solution is designed for organizations using the ServiceNow platform to improve identity and access management. By automating user administration and access control processes, organizations can reduce operational costs, minimize manual errors, strengthen data security, and improve employee productivity. The solution adds value by optimizing existing business processes rather than generating direct revenue.

6. Scalability of the Solution

The solution is designed to support organizational growth by allowing the addition of new users, groups, roles, projects, and workflows without significant changes to the system. As a cloud-based platform, ServiceNow provides scalability, reliability, and flexibility, enabling the solution to adapt to future business requirements while maintaining consistent performance.
